Remember Me?

The process of this investigation was to test if people memorize pictures better than words. I hypothesized that if I showed 10 test subjects 12 pictures and 12 words of my choice, then they will memorize the 12 pictures better. This experiment involved creating two tests with 5 questions in each test. I had to test 10 people from ages 14-16. They were told to look at 12 pictures in 3 second and try to memorize each image. They were also told to look at 12 words in 2 seconds and try to memorize as much as words as they could. The data collected did conclusively support the hypothesis. 9 of the tests subjects memorized the pictures better than the words. Only one test subject memorized the words better than the pictures. These findings helped me to conclude that people memorize pictures better than words. More testing is necessary in order to confirm results.
